CMOS LSI

64 Kbit (8192 × 8) CMOS Static RAM

Overview

LC3564Q series devices are silicon-gate, CMOS static RAMs configured as 8192 × 8 bits. They incorporate an output enable for high-speed memory access, two chip enables for easy memory expansion, and TTL-compatible, tristate outputs for direct interfacing with a bus.

LC3564Q series ICs feature a data retention mode and a low standby current, making them ideal for low-power or battery-powered equipment.

LC3564Q series ICs operate from a 2.7 to 5.5 V supply and are available in 28-pin DIPs, 28-pin SOPs (450 mil) and 28-pin SDIPs.

Notes

1. Hold **WE** HIGH during the read cycle.
2. Do not apply signals to DOUT1 to DOUT8 of opposite phase to the internal lines during write cycle 1.
3. t_{WP} is measured from when **CE1** and **WE** go LOW and **CE2** goes HIGH until one of these pins changes state.
4. t_{CW1} and t_{CW2} are measured from when both **CE1** and **WE** go LOW and **CE2** goes HIGH until one of these pins changes state.
5. DOUT1 to DOUT8 are high impedance when either **CE1** or **OE** is HIGH, or **CE2** or **WE** is LOW.
6. **OE** can be either V_{DI} or V_{DL} during the write cycles.
7. Data is output on DOUT1 to DOUT8 during write cycle 1.
