## Notes:

## Description

The keyboard has 102 keys (101 in the U.S.). At system power-on, the keyboard monitors the signals on the 'clock' and 'data' lines and establishes its line protocol. A bidirectional serial interface in the keyboard converts the 'clock' and 'data' signals and sends this information to and from the keyboard through the keyboard cable.

## Keyboard Layouts

Keyboard layouts are in alphabetic order on the following pages. Nomenclature is on both the top and front face of the keybuttons.

- Belgian
- Canadian French
- Danish
- Dutch
- French
- German
- Italian
- Latin American
- Norwegian
- Portuguese
- Spanish
- Swedish
- Swiss
- U.K. English
- U.S. English.

## Sequential Key-Code Scanning

The keyboard detects all keys pressed and sends each scan code in the correct sequence. When not being serviced by the system, the keyboard stores the scan codes in its buffer.

## Buffer

A 16-byte first-in-first-out (FIFO) buffer in the keyboard stores the scan codes until the system is ready to receive them. A buffer-overrun condition occurs when more than 16 bytes are placed in the keyboard buffer. An overrun code replaces the 17th byte. If more keys are pressed before the system allows keyboard output, the additional data is lost.

When the keyboard is allowed to send data, the bytes in the buffer are sent as in normal operation, and new data entered is detected and sent. Response codes do not occupy a buffer position.

If keystrokes generate a multiple-byte sequence, the entire sequence must fit into the available buffer space, or the keystroke is discarded and a buffer-overrun condition occurs.

## Keys

Except for the Pause key, all keys are makelbreak. The make scan code of a key is sent to the keyboard controller when the key is pressed. When the key is released, its break scan code is sent.

Also, except for the Pause key, all keys are typematic. When a key is pressed and held down, the keyboard sends the make code for that key, delays 500 milliseconds $\pm 20 \%$, and begins sending a make code for that key at a rate of 10.9 characters per second $\pm 20 \%$. The typematic rate and delay can be modified (see "Set Typematic Rate/Delay (Hex F3)" on page 24).

If two or more keys are held down, only the last key pressed repeats at the typematic rate. Typematic operation stops when the last key pressed is released, even if other keys are still held down. If a key is pressed and held down while keyboard transmission is inhibited, only the first make code is stored in the buffer. This prevents buffer overflow caused by typematic action.

Note: Scan-code set 3 allows key types to be changed by the system. See "Set 3 Scan Code Tables" on page 34 for the default settings.

## Power-On Routine

The following activities take place when power is first applied to the keyboard:

## Power-On Reset (POR)

The keyboard logic generates a 'power-on reset' signal when power is first applied to the keyboard. A POR takes a minimum of 150 milliseconds and a maximum of 2.0 seconds from the time power is first applied to the keyboard.

## Basic Assurance Test

The basic assurance test (BAT) consists of a keyboard processor test, a checksum of the read-only memory (ROM), and a random-access memory (RAM) test. During the BAT, activity on the 'clock' and 'data' lines is ignored. The LEDs are turned on at the beginning and off at the end of the BAT. The BAT takes a minimum of 300 milliseconds and a maximum of 500 milliseconds. This is in addition to the time required by the POR.

On satisfactory completion of the BAT, a completion code (hex AA) is sent to the system, and keyboard scanning begins. If a BAT failure occurs, the keyboard sends an error code to the system. The keyboard is then disabled pending command input. Completion codes are sent between 450 milliseconds and 2.5 seconds after the POR, and between 300 and 500 milliseconds after a Reset command is acknowledged.

Immediately following a POR, the keyboard monitors the signals on the keyboard 'clock' and 'data' lines and sets the line protocol.

## Commands from the System

The following figure shows the commands that the system may send and their hexadecimal values.

| Command | Hex Value |
| :--- | :---: |
| Set/Reset Status Indicators | ED |
| Echo | EE |
| Invalid Command | EF |
| Select Alternate Scan Codes | F0 |
| Invalid Command | F1 |
| Read ID | F2 |
| Set Typematic Rate/Delay | F3 |
| Enable | F4 |
| Default Disable | F5 |
| Set Default - Typematic | F6 |
| Set All Keys - Make/Break | F7 |
|  | F8 |
|  | - Make |
| - Typematic/Make/Break | F9 |
| Set Key Type - Typematic | FA |
|  | - Make/Break |
| - Make | FB |
| Resend | FC |
| Reset | FD |
|  | FE |

Figure 1. Keyboard Commands from the System
These commands can be sent to the keyboard at any time. The keyboard responds within 20 milliseconds, except when performing the BAT or executing a Reset command.
Note: Mode 1 accepts only the Reset command.
The following commands are in alphabetic order. They have different meanings when issued by the keyboard (see "Commands to the System" on page 26).

Default Dlsable (Hex F5): The Default Disable command resets all conditions to the power-on default state. The keyboard responds with ACK, clears its output buffer, sets the default key types (scan-code set 3 operation only) and typematic rate/delay, and clears the last typematic key. The keyboard stops scanning and awaits further instructions.

Echo (Hex EE): Echo is a diagnostic aid. When the keyboard receives this command, it issues a hex EE response. If previously enabled, it continues scanning.

Enable (Hex F4): On receipt of this command, the keyboard responds with ACK, clears its output buffer, clears the last typematic key, and starts scanning.

Invalid Command (Hex EF and F1): Hex EF and hex F1 are invalid commands and are not supported. If one of these is sent, the keyboard does not acknowledge the command but returns a Resend command and continues in its prior scanning state. No other activities occur.

Read ID (Hex F2): This command requests identification information from the keyboard. The keyboard responds with ACK, stops scanning, and sends the two keyboard ID bytes. The second byte must follow completion of the first by no more than 500 microseconds. After the output of the second ID byte, the keyboard resumes scanning.

Resend (Hex FE): The system sends this command when it detects an error in any transmission from the keyboard. It is sent only after a keyboard transmission and before the system allows the next keyboard output. When a Resend command is received, the keyboard sends the previous output again (unless the previous output was the Resend command, in which case the keyboard sends the last byte before the Resend command).

Reset (Hex FF): The system issues a Reset command to start a program reset and a keyboard internal self-test. The keyboard acknowledges the command with an ACK and ensures the system accepts ACK before executing the command. The system signals acceptance of ACK by raising the 'clock' and 'data' lines for a minimum of 500 microseconds. The keyboard is disabled from the time it receives the Reset command until ACK is accepted, or until another command is sent that overrides the previous command.

Following acceptance of ACK, the keyboard is reinitialized and performs the BAT. After returning the completion code, the keyboard defaults to scan-code set 2.

Select Alternate Scan Codes (Hex FO): This command instructs the keyboard to select one of three sets of scan codes. The keyboard acknowledges receipt of this command with ACK and clears both the output buffer and the typematic key (if one is active). The system then sends the option byte and the keyboard responds with another ACK. An option byte value of hex 01 selects scan code set 1 , hex 02 selects scan code set 2 , and hex 03 selects scan code set 3.

An option byte value of hex 00 causes the keyboard to acknowledge with an ACK and send a byte telling the system which scan code set is currently in use. To prevent the controller from translating this byte, disable the keyboard-controller translate mode.

After establishing the new scan code set, the keyboard returns to the scanning state it was in before receiving the Select Alternate Scan Codes command.

## Set All Keys (Hex F7, F8, F9, FA)

These commands instruct the keyboard to set all keys to a condition listed in the following figure.

| Hex Value | Command |
| :---: | :--- |
| F7 | Set All Keys - Typematic |
| F8 | Set All Keys - Make/Break |
| F9 | Set All Keys - Make |
| FA | Set All Keys - Typematic/Make/Break |

Figure 2. Set All Keys Commands
The keyboard responds with ACK, clears its output buffer, sets all keys to the condition indicated by the command, and continues scanning (if it was previously enabled). Although these commands can be sent using any scan-code set, they affect only the operation of scan-code set 3.

Set Default (Hex F6): The Set Default command resets all conditions to the power-on default state. The keyboard responds with ACK, clears its output buffer, sets the default key types (scan-code set 3 operation only) and typematic rate/delay, clears the last typematic key, and continues scanning.

Set Key Type (Hex FB, FC, FD): These commands instruct the keyboard to set individual keys to a condition listed in the following figure.

| Hex Value | Command |
| :---: | :--- |
| FB | Set Key Type - Typematic <br> FC <br> FDe Key Type - Make/Break <br> FD |

Figure 3. Set Key Type Commands
The keyboard responds with ACK, clears its output buffer, and prepares to receive key identification. The system identifies each key
by its scan-code value, as defined in scan-code set 3 . Only scan code set 3 values are valid for key identification. The type of each identified key is set to the value indicated by the command.

These commands can be sent using any scan code set, but affect only the operation of scan code set 3.

Set/Reset Status Indicators (Hex ED): Three status indicators on the keyboard-Num Lock, Caps Lock, and Scroll Lock-are accessible by the system. The keyboard activates or deactivates these indicators when it receives a valid command-code sequence from the system. The command sequence begins with the command byte (hex ED). The keyboard responds with ACK, stops scanning, and waits for the option byte from the system. The bit assignments for this option byte are as follows.

| Bit | Function |
| :--- | :--- |
| $7-3$ | Reserved (must be 0's) |
| 2 | Caps Lock Indicator |
| 1 | Num Lock Indicator |
| 0 | Scroll Lock Indicator |

Figure 4. Set/Reset Status Indicators
If a bit for an indicator is set to 1 , the indicator is turned on. If a bit is set to 0 , the indicator is turned off.

The keyboard responds to the option byte with ACK, sets the indicators and, if the keyboard was previously enabled, continues scanning. The state of the indicators reflects the bits in the option byte and can be activated or deactivated in any combination. If another command is received in place of the option byte, execution of the Set/Reset Mode Indicators command is stopped, with no change to the indicator states, and the new command is processed.

Immediately after power-on, the lights default to the Off state. If the Set Default and Default Disable commands are received, the lamps remain in the state they were in before the command was received.

Set Typematic Rate/Delay (Hex F3): The system issues this command to change the typematic rate and delay. The keyboard responds to the command with ACK, stops scanning, and waits for the system to issue the rate/delay value byte. The keyboard responds to the rate/delay value byte with another ACK, sets the rate and delay to the values indicated, and continues scanning (if it was previously enabled). Bits 6 and 5 indicate the delay, and bits $4,3,2,1$, and 0 (the
least-significant bit) indicate the rate. Bit 7, the most-significant bit, is always 0 . The delay is determined by the following equation:

Delay $=(1+A) \times 250$ milliseconds $\pm 20 \%$.
where:
$\mathrm{A}=$ binary value of bits 5 and 6
The period (interval from one typematic output to the next) is determined by the following equation:

```
Period = (8 + A) }\times(\mp@subsup{2}{}{B})\times0.00417 seconds \pm20%
where:
    A = binary value of bits 2, 1, and 0
    B = binary value of bits 4 and 3
```

The typematic rate (make codes per second) is 1 for each period.

| Bit | Typematic <br> Rate $\mathbf{2 0 \%}$ | Bit | Typematic Rate $\mathbf{\pm 2 0 \%}$ |
| :---: | :---: | :---: | :---: |
| 00000 | $\mathbf{3 0 . 0}$ | 10000 | 7.5 |
| 00001 | 26.7 | 10001 | 6.7 |
| 00010 | 24.0 | 10010 | 6.0 |
| 00011 | 21.8 | 10011 | 5.5 |
| 00100 | 20.0 | 10100 | 5.0 |
| 00101 | 18.5 | 10101 | 4.6 |
| 00110 | 17.1 | 10110 | 4.3 |
| 00111 | 16.0 | 10111 | 4.0 |
| 01000 | 15.0 | 11000 | 3.7 |
| 01001 | 13.3 | 11001 | 3.3 |
| 01010 | 12.0 | 11010 | 3.0 |
| 01011 | 10.9 | 11011 | 2.7 |
| 01100 | 10.0 | 11100 | 2.5 |
| 01101 | 9.2 | 11101 | 2.3 |
| 01110 | 8.6 | 11110 | 2.1 |
| 01111 | 8.0 | 11111 | 2.0 |

Figure 5. Typematic Rate
The default values for the system keyboard are as follows:
Typematic rate $=10.9$ characters per second $\pm 20 \%$
Delay $=500$ milliseconds $\pm \mathbf{2 0 \%}$.
The execution of this command stops without change to the existing rate if another command is received instead of the rate/delay value byte.

## Commands to the System

The following figure shows the commands that the keyboard can send to the system, and their hexadecimal values.

| Command | Hex Value |
| :--- | :--- |
| Key Detection Error/Overrun | 00 (Code Sets 2 and 3) |
| Keyboard ID | $83 A B$ |
| BAT Completion Code | AA |
| BAT Failure Code | FC |
| Echo | EE |
| Alknowledge (ACK) | FA |
| Resend | FE |
| Key Detection Error/Overrun | FF (Code Set 1) |

Figure 6. Keyboard Commands to the System
The commands the keyboard sends to the system are described in alphabetic order. They have different meanings when issued by the system.

Acknowledge (Hex FA): The keyboard issues ACK to any valid input other than an Echo, or Resend command. If the keyboard is interrupted while sending ACK, it discards ACK and accepts and responds to the new command.

BAT Completion Code (Hex AA): Following satisfactory completion of the BAT, the keyboard sends hex AA. Any other code indicates a failure of the keyboard.

BAT Fallure Code (Hex FC): If a BAT failure occurs, the keyboard sends this code, stops scanning, and waits for a system response or reset.

Echo (Hex EE): The keyboard sends this code in response to an Echo command.

Keyboard ID (Hex 83AB): The keyboard ID consists of two bytes, hex 83AB. The keyboard responds to the Read ID command with ACK, stops scanning, and sends the two ID bytes. The low byte is sent first followed by the high byte. Following the output of the keyboard ID, the keyboard begins scanning. Because of keyboard controller translation, the keyboard ID might not be returned to the system as hex 83AB.

Key Detection Error (Hex 00 or FF): The keyboard sends a key detection error character if conditions in the keyboard make it impossible to identify a switch closure. If the keyboard is using scan-code set 1 , the code is hex FF. For sets 2 and 3, the code is hex 00.

Overrun (Hex 00 or FF): An overrun character is placed in the keyboard buffer and replaces the last code when the buffer capacity has been exceeded. The code is sent to the system when it reaches the top of the buffer queue. If the keyboard is using scan code set 1 , the code is hex FF. For sets 2 and 3 , the code is hex 00.

Resend (Hex FE): The keyboard issues a Resend command following receipt of an invalid input, or any input with incorrect parity. If the system sends nothing to the keyboard, no response is required.

## Scan Codes

The following figures list the key numbers of the three scan code sets and their hexadecimal values. The system defaults to scan set 2 , but can be switched to set 1 or set 3 (see "Select Alternate Scan Codes (Hex F0)" on page 22).

## Set 1 Scan-Code Tables

In scan-code set 1, each key is assigned a base scan code and, sometimes, extra codes to generate artificial shift states in the system. The typematic scan codes are identical to the base scan code for each key.

The following figure shows the codes sent for the keys, regardless of any shift states in the keyboard or system. Refer to "Keyboard Layouts" beginning on page 1 to determine the character associated with each key number.

| Number | Mak Code | Break Code | $\begin{array}{r} \text { Key } \\ \text { Number } \end{array}$ | Make Code | Break Code |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 29 | A9 | 47 | 2D | AD |
| 2 | 02 | 82 | 48 | 2E | AE |
| 3 | 03 | 83 | 49 | 2 F | AF |
| 4 | 04 | 84 | 50 | 30 | B0 |
| 5 | 05 | 85 | 51 | 31 | B1 |
| 6 | 06 | 86 | 52 | 32 | B2 |

| 46 | 2 C | AC | 125 | 46 | C6 |
| Note: * 101-key keyboard only, ** 102-key keyboard only. |  |  |  |  |  |

Figure 7. Keyboard Scan Codes, Set 1

The remaining keys send a series of codes that are dependent on the states of the various shift keys (Ctrl, Alt, and Shift), and the state of Num Lock (On or Off). Because the base scan code is identical to another key, an extra code (hex EO) has been added to the base code to make it unique.

| Koy No. | Base Case, or Shift + Num Lock Make/Break | 8hift Case Mako/Break * | Num Lock on Make/Break |
| :---: | :---: | :---: | :---: |
| 75 | $\begin{aligned} & \text { EO } 52 \\ & \text { IEO D2 } \end{aligned}$ | EO AA EO 52 /E0 D2 E0 2A | $\begin{aligned} & \text { EO 2A EO } 52 \\ & \text { IEO D2 EO AA } \end{aligned}$ |

| the key. |  |  |

Figure 11. Keyboard Scan Codes, Set 1

## Set 2 Scan-Code Tables

In scan-code set 2, each key is assigned a unique 8-bit make scan code, which is sent when the key is pressed. Each key also sends a break code when the key is released. The break code consists of 2 bytes, the first of which is the break code prefix, hex F0; the second byte is the same as the make scan code for that key. The typematic scan code for a key is the same as the key's make code.

The following figure shows the codes sent for the keys, regardless of any shift states in the keyboard or system. Refer to "Keyboard Layouts" beginning on page 1 to determine the character associated with each key number.

| $\begin{array}{r} \text { Key } \\ \text { Number } \end{array}$ | Make Code | Break Code | $\begin{array}{r} \text { Key } \\ \text { Number } \end{array}$ | Make Code | Break Code |
| :---: | :---: | :---: | :---: | :---: | :---: |

Figure 12. Keyboard Scan Codes, Set 2

The remaining keys send a series of codes that are dependent on the state of the shift keys (Ctrl, Alt, and Shift), and the state of Num Lock (On or Off). Because the base scan code is identical to another key, an extra code (hex EO) is added to the base code to make it unique.

## Set 3 Scan Code Tables

In scan-code set 3, each key is assigned a unique 8-bit make scan code, which is sent when the key is pressed. Each key also sends a break code when the key is released. The break code consists of two bytes, the first of which is the break-code prefix, hex FO; the second byte is the same as the make scan code for that key. The typematic scan code for a key is the same as the key's make code. With this scan-code set, each key sends only one scan code, and no keys are affected by the state of any other keys.

The following figure shows the codes sent for the keys, regardless of any shift states in the keyboard or system. Refer to "Keyboard Layouts" beginning on page 1 to determine the character associated with each key number.

| Key Number | Make Code | Break Code | Default Key State |

Figure 17 (Part 3 of 3). Keyboard Scan Codes, Set 3

## Clock and Data Signals

The keyboard and system communicate over the 'clock' and 'data' lines. The source of each of these lines is an open-collector device on the keyboard that allows either the keyboard or system to force a line to an inactive (low) level. When no communication is occurring, the 'clock' line is at an active (high) level. The state of the 'data' line is held active (high) by the keyboard.

When the system sends data to the keyboard, it forces the 'data' line to an inactive level and allows the 'clock' line to go to an active level.

An inactive signal has a value of at least 0 volts, but not more than +0.7 volts. A signal at the inactive level is a logical 0 . An active signal has a value of at least +2.4 volts, but not more than +5.5 volts. A signal at the active level is a logical 1. Voltages are measured between a signal source and the dc network ground.

When the keyboard sends data to, or receives data from the system, it generates the 'clock' signal to time the data. The system can prevent the keyboard from sending data by forcing the 'clock' line to an inactive level; the 'data' line can be active or inactive during this time.

During the BAT, the keyboard allows the 'clock' and 'data' lines to go to an active level.

## Data Stream

Data transmissions to and from the keyboard consist of an 11-bit data stream (Mode 2) sent serially over the 'data' line. The following figure shows the functions of the bits.

| Bit | Function |
| :--- | :--- |
| 11 | Stop bit (always 1) |
| 10 | Parity bit (odd parity) |
| 9 | Data bit 7 (most-significant) |
| 8 | Data bit 6 |
| 7 | Data bit 5 |
| 6 | Data bit 4 |
| 5 | Data bit 3 |
| 4 | Data bit 2 |
| 3 | Data bit 1 |
| 2 | Data bit 0 (least-significant) |
| 1 | Start bit (always 0) |

Figure 18. Keyboard Data Stream Bit Definitions
The parity bit is either 1 or 0 , and the 8 data bits, plus the parity bit, always have an odd number of 1 's.

Note: Mode 1 is a 9-bit data stream that does not have a parity bit or stop bit, and the start bit is always 1.

## Data Output

When the keyboard is ready to send data, it first checks for a keyboard-inhibit or system request-to-send status on the 'clock' and 'data' lines. If the 'clock' line is inactive (low), data is stored in the keyboard buffer. If the 'clock' line is active (high) and the 'data' line is inactive (request-to-send), data is stored in the keyboard buffer, and the keyboard receives system data.

If the 'clock' and 'data' lines are both active, the keyboard sends the 0 start bit, 8 data bits, the parity bit, and the stop bit. Data is valid before the trailing edge and beyond the leading edge of the clock pulse. During transmission, the keyboard checks the 'clock' line for an active level at least every 60 milliseconds. If the system lowers the 'clock' line from an active level after the keyboard starts sending data, a condition known as line contention occurs, and the keyboard stops sending data. If line contention occurs before the leading edge of the 10th clock signal (parity bit), the keyboard buffer returns the 'clock' and 'data' lines to an active level. If contention does not occur by the 10th clock signal, the keyboard completes the transmission. Following line contention, the system may or may not request the keyboard to resend the data.

Following a transmission, the system can inhibit the keyboard until the system processes the input, or until it requests that a response be sent.

## Data Input

When the system is ready to send data to the keyboard, it first checks to see if the keyboard is sending data. If the keyboard is sending, but has not reached the 10th 'clock' signal, the system can override the keyboard output by forcing the keyboard 'clock' line to an inactive ${ }^{\bullet}$ (low) level. If the keyboard transmission is beyond the 10th 'clock' signal, the system must receive the transmission.

If the keyboard is not sending, or if the system elects to override the keyboard's output, the system forces the keyboard 'clock' line to an inactive level for more than 60 microseconds while preparing to send data. When the system is ready to send the start bit (the 'data' line will be inactive), it allows the 'clock' line to go to an active (high) level.

The keyboard checks the state of the 'clock' line at intervals of no more than 10 milliseconds. If a system request-to-send signal (RTS) is detected, the keyboard counts 11 bits. After the 10th bit, the keyboard checks for an active level on the 'data' line, and if the line is active, forces it inactive and counts one more bit. This action signals the system that the keyboard has received its data. On receipt of this signal, the system returns to a ready state, in which it can accept keyboard output, or goes to the inhibited state until it is ready.

If the keyboard 'data' line is found at an inactive level following the 10th bit, a framing error has occurred, and the keyboard continues to count until the 'data' line becomes active. The keyboard then makes the 'data' line inactive and sends a Resend command.

Each system command or data transmission to the keyboard requires a response from the keyboard before the system can send its next output. The keyboard will respond within 20 milliseconds unless the system prevents keyboard output. If the keyboard response is invalid or has a parity error, the system sends the command or data again. However, two-byte commands require special handling. If hex F3 (Set Typematic Rate/Delay), hex F0 (Select Alternate Scan Codes), or hex ED (Set/Reset Mode Indicators) have been sent and acknowledged, and the value byte has been sent but the response is invalid or has a parity error, the system resends both the command and the value byte.

## Encode and Usage

The keyboard routine, provided in the ROM BIOS, is responsible for converting the keyboard scan codes into what is called Extended ASCII. The extended ASCII codes returned by the ROM routine are mapped to the U.S. English keyboard layout. Some operating systems might make provisions for alternate keyboard layouts by providing an interrupt replacement routine, which resides in the read/write memory. This section discusses only the ROM routine.

Extended ASCII encompasses one-byte character codes with possible values of 0 to $\mathbf{2 5 5}$, an extended code for certain extended keyboard functions, and functions handled within the keyboard routine or through interrupts.

The character codes are passed through the BIOS keyboard routine to the system or application program. In the following figure " -1 " means the combination is suppressed in the keyboard routine. The codes are returned in the AL register.

| 104 | . | Delete (*,**) | (**) | (**) |
| 105 | - | Sys Request | -1 | -1 |
| 106 | + | + (*) | -1 | -1 |
| Note: (") Refer to "Extended Functions." (") Refer to "Special Handling" on page 47. |  |  |  |  |

Figure 20. Special Character Codes

## Extended Functions

For certain functions that cannot be represented by a standard ASCII code, an extended code is used. A character code of 000 (null) is returned in AL. This indicates that the system or application program should examine a second code, which indicates the actual function. Usually, but not always, this second code is the scan code of the primary key that was pressed. This code is returned in AH.

The following figure is a list of the extended codes and their functions.

| Second Code | Function |
| :---: | :---: |
| , | Alt Esc |
| 3 | Null Character |
| 14 | Alt Backspace |
| 15 | $1 \longleftarrow$ (Back-tab) |
| 16-25 | Alt Q, W, E, R, T, Y, U, I, O, P |
| 26-28 | Alt [ ] $\downarrow$ |
| 30-38 | Alt A, S, D, F, G, H, J, K, L |
| 39-41 | Alt ; ', |
| 43 | Alt 1 |
| 44-50 | Alt Z, X, C, V, B, N, M |
| 51-53 | Alt , . $/$ |
| 55 | Alt Keypad * |
| 59-68 | F1 to F10 Function Keys (Base Case) |
| 71 | Home |
| 72 | $\uparrow$ (Cursor Up) |
| 73 | Page Up |
| 74 | Alt Keypad - |
| 75 | $\leftarrow$ (Cursor Left) |
| 76 | Center Cursor |
| 77 | $\rightarrow$ (Cursor Right) |
| 78 | Alt Keypad + |
| 79 | End |
| 80 | $\downarrow$ (Cursor Down) |
| 81 | Page Down |
| 82 | Ins (Insert) |
| 83 | Del (Delete) |
| 84-93 | Shift F1 to F10 |
| 94-103 | Ctri F1 to F10 |
| 104-113 | Alt F1 to F10 |
| 114 | Ctrl Prisc (Start/Stop Echo to Printer) |
| 115 | Ctrl $\leftarrow$ (Reverse Word) |
| 116 | Ctrl $\rightarrow$ (Advance Word) |
| 117 | Ctrl End (Erase to End of Line-EOL) |
| 118 | Ctrl PgDn (Erase to End of Screen-EOS) |
| 119 | Ctrl Home (Clear Screen and Home) |
| 120-131 | Alt 1, 2, 3, 4, 5, 6, 7, 8, 9, 0, $-=$ keys 2-13 |
| 132 | Ctrl Pgup (Top 25 Lines of Text and Cursor Home) |
| 133-134 | F11, F12 |
| 135-138 | Shift F11, F12 |
| 137-138 | Ctrl F11, F12 |
| 139-140 | Alt F11, F12 |

Figure 21 (Part 1 of 2). Keyboard Extended Functions

| Second Code | Function |
| :---: | :--- |
| 141 | Ctri Up/8 |
| 142 | Ctri Keypad - |
| 143 | Ctri Keypad 5 |
| 144 | Ctri Keypad + |
| 145 | Ctri Down/2 |
| 146 | Ctril Ins/0 |
| 147 | Ctri Del/. |
| 148 | Ctri Tab |
| 149 | Ctri Keypad / |
| 150 | Ctri Keypad |
| 151 | Alt Home |
| 152 | Alt Up |
| 153 | Alt Page Up |
| 155 | Alt Left |
| 157 | Alt Right |
| 159 | Alt End |
| 160 | Alt Down |
| 161 | Alt Page Down |
| 162 | Alt Insert |
| 163 | Alt Delete |
| 164 | Alt Keypad / |
| 165 | Alt Tab |
| 166 | Alt Enter |

Figure 21 (Part 2 of 2). Keyboard Extended Functions

## Shift States

Most shift states are handed within the keyboard routine and are not apparent to the system or application program. In any case, the current status of active shift states is available by calling an entry point in the BIOS keyboard routine. The following keys result in altered shift states:

Shift: This key temporarily shifts keys 1 through 13, 16 through 29, 31 through 41, and 46 through 55 to uppercase (base case if in Caps Lock state). Also, the Shift key temporarily reverses the Num Lock or non-Num Lock state of keys 91 through 93, 96, 98, 99, and 101 through 104.

Ctrl: This key temporarily shifts keys 3, 7, 12, 15 through 29, 31 through 39, 43, 46 through 52, 75 through 89, 91 through 93,95 through 108, 112 through 124, and 126 to the Ctrl state. The Ctrl key is also used with the Alt and Del keys to initiate the system-reset function, with the Scroll Lock key to initiate the break function, and with the Num Lock key to initiate the pause function. The system-reset, break, and pause functions are described under "Special Handling" on page 47.

Alt: This key temporarily shifts keys 1 through 29, 31 through 43, 46 through 55, 75 through 89, 95, 100, and 105 through 124 to the Alt state. The Alt key is also used with the Ctrl and Del keys to cause a system reset.

The Alt key also allows the user to enter any character code from 1 to 255. The user holds down the Alt key and types the decimal value of the characters desired on the numeric keypad (keys 91 through 93, 96 through 99, and 101 through 103). The Alt key is then released. If the number is greater than 255, a modulo-256 value is used. This value is interpreted as a character code and is sent through the keyboard routine to the system or application program. Alt is handled internally in the keyboard routine.

Caps Lock: This key shifts keys 17 through 26, 31 through 39, and 46 through 52 to uppercase. When Caps Lock is pressed again, it reverses the action. Caps Lock is handled internally in the keyboard routine. When Caps Lock is pressed, it changes the Caps Lock mode indicator. If the indicator was on, it goes off; if it was off, it goes on.

Scroll Lock: When interpreted by appropriate application programs, this key indicates that the cursor-control keys will cause windowing over the text rather than moving the cursor. When the Scroll Lock key is pressed again, it reverses the action. The keyboard routine simply records the current shift state of the Scroll Lock key. It is the responsibility of the application program to perform the function. When Scroll Lock is pressed, it changes the Scroll Lock mode indicator. If the indicator was on, it goes off; if it was off, it goes on.

Num Lock: This key shifts keys 91 through 93, 96 through 99, and 101 through 104 to uppercase. When Num Lock is pressed again, it reverses the action. Num Lock is handled internally in the keyboard routine. When Num Lock is pressed, it changes the Num Lock mode indicator. If the indicator was on, it goes off; if it was off, it goes on.

Shift Key Priorities and Combinations: If combinations of the Alt, Ctrl, and Shift keys are pressed and only one is valid, the priority is: Alt key first, Ctrl key second, and Shift key third. The only valid combination is Alt and Ctrl, which is used in the system-reset function.

## Special Handling

## System Reset

The combination of Alt, Ctrl, and Del keys results in the keyboard routine that starts a system reset or restart. System reset is handied by system BIOS.

## Break

The combination of the Ctrl and Pause/Break keys results in the keyboard buffer being cleared. The keyboard routine then signals interrupt 1B, and the extended characters $\mathrm{AL}=$ hex 00 , and $\mathrm{AH}=$ hex 00 are stored in the buffer.

## Pause

The Pause key causes the keyboard interrupt routine to loop, waiting for any character or function key to be pressed. This provides a method of temporarily suspending an operation, such as listing or printing, and then resuming the operation. The method is not apparent to either the system or the application program. The key stroke used to resume operation is discarded. Pause is handled internally in the keyboard routine.

## Print Screen

The Print Screen key results in an interrupt invoking the print-screen routine. This routine works in the alphanumeric or graphics mode, with unrecognizable characters causing blanks.

## System Request

When the System Request (Alt and Print Screen) key is pressed, a hex 8500 is placed in AX, and an interrupt hex 15 is executed. When the System Request key is released, a hex 8501 is placed in AX, and another interrupt hex 15 is executed. If an application is to use System Request, the following rules must be observed:

Save the previous address.
Overlay interrupt vector hex 15.
Check AH for a value of hex 85 :
If yes, process may begin.
If no, go to previous address.
The application program must preserve the value in all registers, except AX, on return. System Request is handled internally in the keyboard routine.

## Other Characteristics

The keyboard routine does its own buffering, and the keyboard buffer is large enough to support entries by a fast typist. However, if a key is pressed when the buffer is full, the key is ignored and the alarm sounds.

The keyboard routine also suppresses the typematic action of the following keys: Ctrl, Shift, Alt, Num Lock, Scroll Lock, Caps Lock, and Ins.

During each interrupt hex 09 from the keyboard, an interrupt hex 15, function (AH) = hex 4F is generated by the BIOS after the scan code is read from the keyboard adapter. The scan code is passed in the AL register with the carry flag set. This allows an operating system to intercept each scan code before it is handled by the interrupt hex 09 routine and change or act on the scan code. If the carry flag is changed to 0 on return from interrupt hex 15, the scan code is ignored by the interrupt handler.

## Cables and Connectors

The keyboard cable connects to the system with a 6-pin miniature DIN connector and to the keyboard with a 6-position connector. The following figures show the pin configuration and signal assignments.

| DIN Connector <br> PIns | Signal Name | Keyboard Connector PIns |
| :---: | :---: | :---: |
| 1 | +KBD DATA | B |
| 2 | Reserved | F |
| 3 | Ground | C |
| 4 | +5.0 Vdc | E |
| 5 | +KBD CLK | D |
| 6 | Reserved | A |
| Shield | Frame Ground | Shield |

Figure 22. Keyboard Connectors Signal and Voltage Assignments

## Specifications

Specifications for the keyboard are as follows:

## Power Requirements

- $+5 \mathrm{Vdc} \pm 10 \%$
- 275 mA .

## Size

- Length: 492 millimeters ( 19.4 inches)
- Depth: 210 millimeters ( 8.3 inches)
- Height: 58 millimeters ( 2.3 inches), legs extended.

## Weight

- 2.25 kilograms ( 5.0 pounds).
